Zanzibar Gem Black + White Installation
@ SHUUBA Design Studio

Zamioculcas zamiifolia more commonly known as Zanzibar Gem is a popular variety of tropical perennial houseplant native to eastern Africa. Its beautiful glossy leaves reflect black in bright light.

These plants are hard to kill but do have specific requirements to thrive outside of their native habitat. Ideal conditions require at least six hours a day of high-quality full spectrum light and exposure to 40-50% humidity.

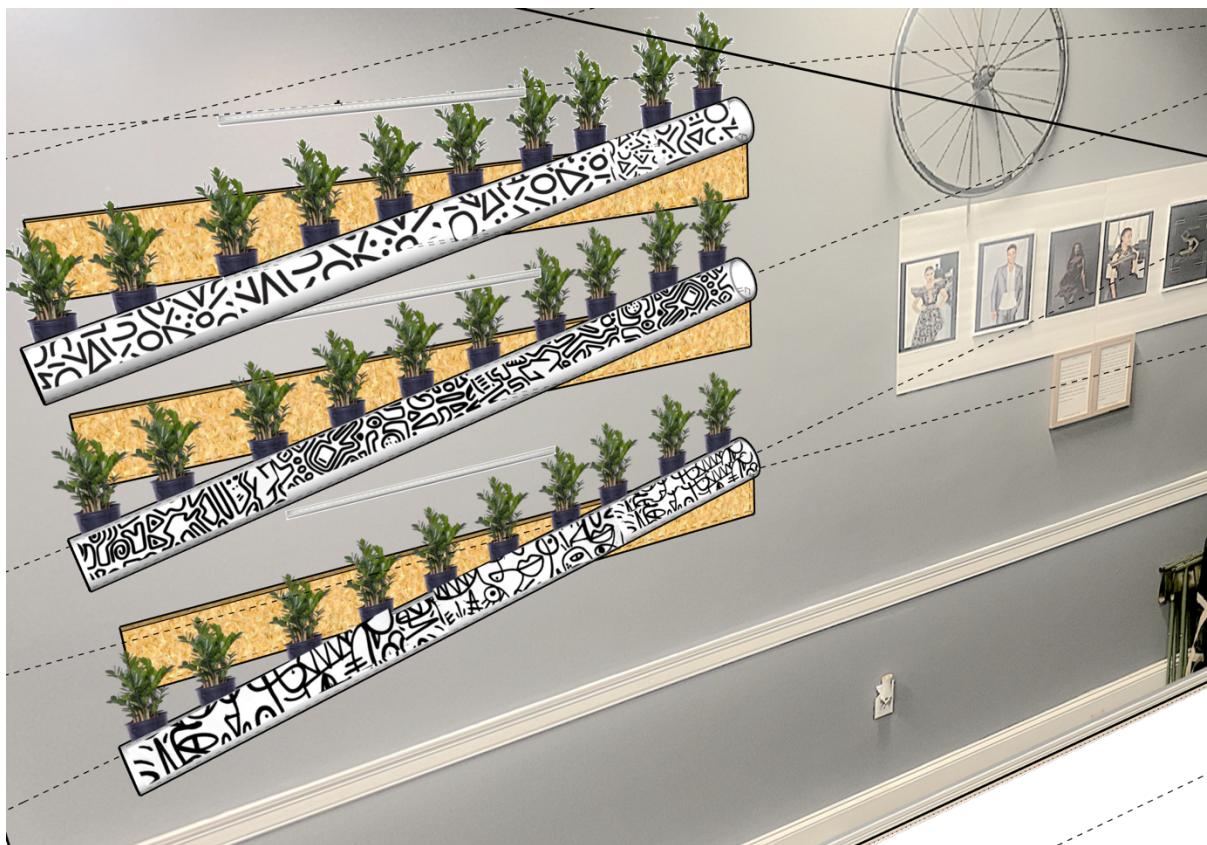

The current design addresses these challenges through use of 4" plastic nursery pots and humidity caps in conjunction with 2' full spectrum grow lights.

In order to make effective use of the studio space, the current dimensions of the design are limited to 4ft x 5ft.

The display's construction consists of 3 5' lengths of 4" diameter PVC pipe mounted with steel French cleats to 3 lengths of repurposed timber.

PVC is a strong material that's easy to decorate according to the needs of the studio. Black permanent marker graffiti-style tags ornament the three shelves.

As a function of supplying bright natural colored light, humidity, and air-purifying plant material, the Zanzibar Gem 30-unit nursery design will promote positive energy and a splash of color to the studio's entrance and office areas.

The total cost of the installation including all materials and installation fees is \$ ~~14~~ pending approval from the client.
